

Conditions that may benefit from Fortizel®

Fortizel® is helpful for many conditions, but specifically those attacking the immune system. Those suffering from the following deficiencies will benefit greatly from this revolutionary formula called Fortizel®:

Allergies

An allergy is the overshooting defense reaction of the immune system against non-harmful environmental substances (allergens). Fortizel® contains various forms of immunoglobulin IgE that diminishes such allergic reactions. Moreover, Proline-rich polypeptides (PRP) found in Fortizel® also help combat an overactive immune system, resulting in allergies, asthma and other autoimmune disorders.

Pain and Inflammation

Painkillers should be a last resort for pain management. Not only are they addicting, they can have harmful side effects and don't really address the problem. Fortizel® contains active anti-inflammatory substances like interleukin 10, a powerful immunoregulator in the intestinal tract as well as lactoferrin; an important part of the immune system that has antimicrobial activity battling fungus and bacteria. It is possible to manage pain, naturally.

Depression

Fortizel® has a balancing effect on the psyche. It contains ingredients that are extremely effective for mental balance, including PRPs and L-tryptophane. L-tryptophane is an amino acid and a first-stage substance in production serotonin. Serotonin is the "happiness" hormone, responsible for maintaining our mood balance.

Diabetes and Obesity

Although poor diet and lack of exercise are significant contributors to obesity, growth factors also play a role. With aging, growth factors like IGF are produced in lesser amounts. As a result, we see an increase in fatty tissue throughout the body. Fortizel® stimulates the production of IGF and thus helps in reducing obesity.

The IGF 1 contained in Fortizel® helps in the production of insulin and IGF 1 naturally occurring in the body. IGF 1 also stimulates the glucose utilization process, resulting in the regulation and management of blood sugar levels.

Cancer and Auto-immune Diseases

The peptides contained in Fortizel® deregulate the fostering of osteosarcoma cells. Lactoferrin is an iron-attaching protein that disables micro-organisms causing tumors; chaining them with free iron ions and reducing cancer growth. Furthermore, lactoferrin available in Fortizel® promotes the body's ability to utilize iron, which is necessary in protecting the body against disease.

The special combination of immunoglobulins in Fortizel® helps stabilize AIDS and HIV-patients.

Fortizel® has also been found to work in cases of multiple sclerosis, measles and many other auto immune diseases.

The contents of Fortizel® are very effective for a host of critical diseases and disorders. No other food supplement can promise the innumerable benefits found in Fortizel® without negative side effects. Fortizel® is unsurpassed by anything like it on the market and safe for all ages.
